

global mapper mobile

Version 2.3

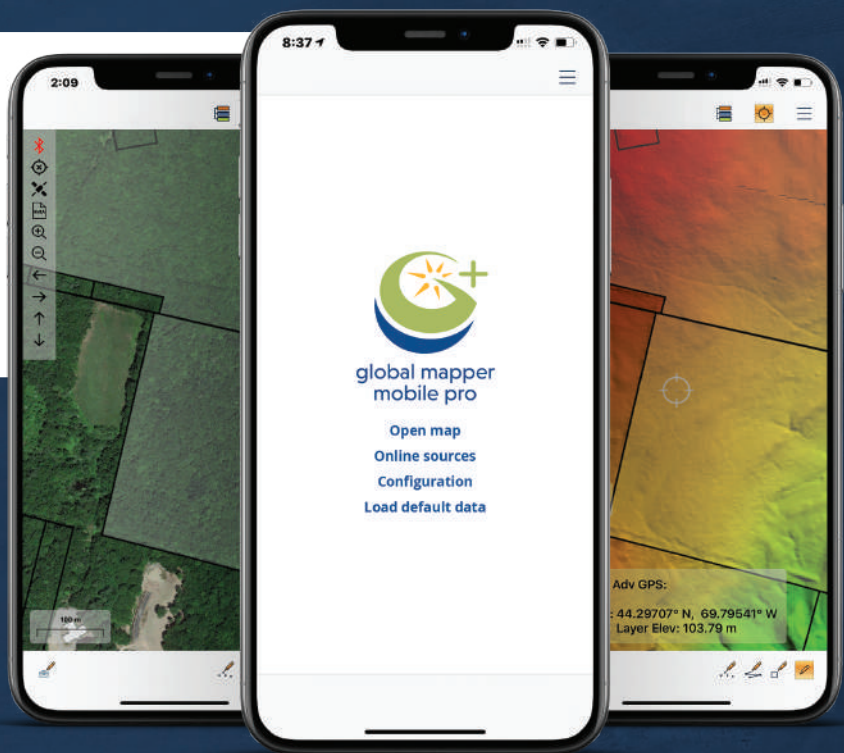

Version 2.3 of Global Mapper Mobile is here! Designed to work with Global Mapper to take data into the field for reference and data collection, the iOS and Android versions of the Global Mapper Mobile app offer exciting, advanced features for enhanced GNSS use and analysis. Join us at our next webinar to find out what's new in version 2.3 of Global Mapper Mobile, now available for download in your mobile app store. In the webinar, we'll discuss the latest features, including:

- **Record voice memos** - when creating a feature, a voice memo can be recorded and associated with the feature in the same way that an image can be saved;
- **Save multiple pictures to a feature** - take/save multiple pictures associated with a given feature;
- **Autosave** - automatic backup of active GMMP every five minutes when changes have been made;
- **Advanced GPS now supports TCP/IP Communication** - connect to any GNSS device which supports communication over TCP/IP. This new feature greatly expands potential device support, especially on iOS, where this is not as restricted as Bluetooth;
- **Support for new GNSS hardware** - Juniper Geode GNS3 and Garmin GLO;
- **Volume Calculation** - ability to calculate volume, either from a preloaded area feature or from an area feature that the user created in the field;
- **Viewshed** - calculate a viewshed analysis from point features recorded in the field; and
- **Native support for UTM and SPCS projections** - added native support for UTM and SPCS-based projections based on customer request feedback.

Download Global Mapper Mobile from your app store today and register for the upcoming webinar at bluemarblegeo.com to learn more.
